

PROJECT REPORT

FASTAG Scam Detection Tool

1. Student Details

- **Name:** Aryan Mewada
- **Registration No.:** 26MIM10234
- **Course:** Python Essentials

2. Introduction

With the rapid growth of digital payments in India fastag has become a widely used system for toll payments. However, along with this convenience, online scams have also increased significantly. Many users receive fake messages and links related to fastag recharge that offer cashback or create urgency to trick them.

This project focuses on creating a simple and effective Python-based tool that helps users identify such scam messages and links. It also spreads awareness about digital safety.

3. Problem Statement

Many people fall victim to fake fastag recharge scams due to lack of awareness. Scammers use attractive offers and urgent messages to manipulate users into clicking malicious links and sharing sensitive information.

There is a need for a simple tool that can help users identify suspicious links and messages before taking any action.

4. Objectives

- To detect suspicious FASTAG recharge links
- To analyze messages for scam-related keywords
- To classify risk levels (Low, Medium, High)
- To spread awareness about online scams

5. Methodology

The project is developed using Python and works on a keyword-based detection system.

- The user selects an option from the menu:
 - Check a link
 - Analyze a message
 - View safety tips
- The program checks the input for suspicious keywords such as:
 - "cashback", "urgent", "offer", "click now"
- Based on the number of suspicious words found:
 - Low Risk → Safe
 - Medium Risk → Be cautious
 - High Risk → Potential scam
- The program also provides safety tips to avoid scams.

6. Tools and Technologies Used

- **Programming Language:** Python
- **Editor:** Visual Studio Code (VS Code)
- **Version Control:** GitHub

7. Features of the Project

- Detection of suspicious links
- Analysis of scam messages
- Risk level classification
- User-friendly menu system
- Display of safety tips

8. Challenges Faced

- Selecting relevant and effective scam keywords
- Designing a simple but meaningful detection logic
- Ensuring the program is easy to use for beginners

9. Output

The program successfully:

- Identifies suspicious links and messages
- Displays appropriate risk levels
- Provides helpful safety tips

(Output screenshots are attached in the GitHub repository.)

10. Conclusion

This project demonstrates how Python can be used to solve real-world problems in a simple and effective way. It helps users become more aware of online scams and encourages safe digital practices.
